OSCAR *v2.2*

Manual

Basic simulation

To make a basic simulation, one needs to execute the main file `OSCAR.py` after what the `OSCAR_lite` function will be available. Execution of the function without any argument will launch a simulation with the options specified in `OSCAR.py`. One can manually change the drivers of OSCAR by specifying their values as arguments of the main function. More generally, a look at the function definition in `OSCAR-fct.py` is strongly advised, as one can see the various optional arguments (and their default value), such as the choice of output variables or the possibility to use OSCAR in a concentration-driven fashion. Some automatic plots can be activated with the plot argument, but they may be outdated. A code example to use OSCAR in a probabilistic setup is provided in the `test_overall.py` file.

Simulation options

Any simulation with OSCAR should start with executing the main file `OSCAR.py` in which all the options for the simulation are set. The provided file is set to the "default" parameterization of the model -- i.e. a sort of "average" parameterization that simulates a reasonable climate change over the historical period. Even in a probabilistic setup the `OSCAR.py` should be executed once, so as to load everything. Only after should the probabilistic loading/simulating occur (as in `test_overall.py`). The following table describes the various options available:

Option	Description
p	Number of time-steps within one year of simulation.
fC	(NOT IMPLEMENTED)
fT	Turn on or off the climate feedbacks.
dty	Precision of numerical computation.
PI_1750	Boolean. If `False`, the years 1700 to 1750 are simulated. This has very little effect on the numerical outputs and it can be used to test the stability of the model.
ind_final	End year of simulation.
ind_attrib	(USELESS)
attrib_DRIVERS	(USELESS)
attrib_FEEDBACKS	(USELESS)
attrib_ELUCdelta	(USELESS)
attrib_ELUCampli	(USELESS)

Option	Description
mod_regionI	Regional aggregation. New regions can be defined manually as aggregates of GTAP7 regions, but it requires coding and extension of the #DATA.Regions_GTAP.csv file.
mod_regionJ	(USELESS)
mod_sector	(USELESS)
mod_kindFF	(USELESS)
mod_kindLUC	(USELESS)
mod_kindGHG	(USELESS)
mod_kindCHI	(USELESS)
mod_kingAER	(USELESS)
mod_kindRF	(USELESS)
mod_kindGE	(USELESS)
mod_biomeSHR	How the "shrubland" biome is accounted for.
mod_biomeURB	How the "urban" biome is accounted for.
data_EFF	Dataset for fossil-fuel emissions.
data_LULCC	Dataset of land-use and land-cover change drivers.
data_ECH4	Dataset for methane emissions.
data_EN2O	Dataset for nitrous oxide emissions.
data_Ehalo	Dataset for halogenated compounds emissions.
data_ENOX	Dataset for nitrogen oxides emissions.
data_ECO	Dataset for carbon monoxide emissions.
data_EVOC	Dataset for volatile organic compounds emissions
data_ESO2	Dataset for sulfur dioxide emissions.
data_ENH3	Dataset for ammonia emissions.
data_EOC	Dataset for organic carbon emissions.
data_EBC	Dataset for black carbon emissions.
data_RFant	Dataset for other anthropogenic RF.
data_RFnat	Dataset for natural RF.
mod_DATAscen	How the transition between historical emissions and scenarios is handled.
scen_ALL	Scenario for all drivers. Has priority over other scen_ options.

Option	Description
scen_EFF	Scenario for fossil-fuel emissions.
scen_LULCC	Scenario of land-use and land-cover change drivers.
scen_ECH4	Scenario for methane emissions.
scen_EN2O	Scenario for nitrous oxide emissions.
scen_Ehalo	Scenario for halogenated compounds emissions.
scen_ENOX	Scenario for nitrogen oxides emissions.
scen_ECO	Scenario for carbon monoxide emissions.
scen_EVOC	Scenario for volatile organic compounds emissions
scen_ESO2	Scenario for sulfur dioxide emissions.
scen_ENH3	Scenario for ammonia emissions.
scen_EOC	Scenario for organic carbon emissions.
scen_EBC	Scenario for black carbon emissions.
scen_RFant	Scenario for other anthropogenic RF.
scen_RFnat	Scenario for natural RF.
mod_OSNKstruct	Structure and impulse response function of the ocean C-cycle model.
mod_OSNKchem	Function emulating the carbonate chemistry.
mod_OSNKtrans	Transient response of the MLD.
mod_LSNKnpp	Functional form of fertilization effect.
mod_LSNKrho	Functional form of heterotrophic respiration rate.
mod_LSNKpreind	Preindustrial land carbon stocks and fluxes.
mod_LSNKtrans	Transient response of NPP and HR.
mod_LSNKcover	Preindustrial natural land-cover.
mod_EFIREpreind	Preindustrial wildfire fluxes.
mod_EFIREtrans	Transient response of wildfires.
mod_ELUCagb	Above-ground biomass fractions.
mod_EHWPbb	Biomass burning of non-commercial harvested wood products.
mod_EHWPtau	Time constants for the oxidation of HWPs.
mod_EHWPfct	Functional form for the oxidation of HWPs.
mod_OHSNKtau	Lifetime of methane with respect to the OH sink.
mod_OHSNKfct	Functional form of the OH sink's response to ozone precursors.

Option	Description
mod_OHSNKtrans	Transient response of the OH sink.
mod_EWETpreind	Preindustrial wetlands emissions.
mod_AWETtrans	Transient response of wetlands area extent.
mod_HVSNKtau	Lifetime of nitrous oxide with respect to the stratospheric sink.
mod_HVSNKtrans	Transient response of the stratospheric sink.
mod_HVSNKcirc	Transient response of the stratospheric age-of-air.
mod_O3Tregsat	Regionalization of the tropospheric O3 chemistry.
mod_O3Temis	Transient response of tropospheric O3 to precursors and methane.
mod_O3Tclim	Transient response of tropospheric O3 to climate.
mod_O3Tradeff	Radiative efficiency of tropospheric O3.
mod_O3Sfracrel	Fractional release factors for EESC.
mod_O3Strans	Transient response of stratospheric O3 to EESC and climate.
mod_O3Snitrous	Transient response of stratospheric O3 to N2O.
mod_O3Sradeff	Radiative efficiency of stratospheric O3.
mod_SO4regsat	Regionalization of SO4 burden.
mod_SO4load	Transient response of SO4 burden.
mod_SO4radeff	Radiative efficiency of SO4.
mod_POAconv	Conversion factor for OC/OM.
mod_POAregsat	Regionalization of POA burden.
mod_POAload	Transient response of POA burden.
mod_POAradeff	Radiative efficiency of POA.
mod_BCregsat	Regionalization of BC burden.
mod_BCload	Transient response of BC burden.
mod_BCradeff	Radiative efficiency of BC.
mod_BCadjust	Semi-direct effect of BC.
mod_NO3load	Transient response of NO3 burden.
mod_NO3radeff	Radiative efficiency of NO3.
mod_SOAload	Transient response of SOA burden.
mod_SOAradeff	Radiative efficiency of SOA.
mod_DUSTload	(NOT DESCRIBED IN PAPER) Transient response of mineral dust burden.

Option	Description
mod_DUSTradeff	(NOT IMPLEMENTED)
mod_SALTload	(NOT DESCRIBED IN PAPER) Transient response of sea salt burden.
mod_SALTradeff	(NOT IMPLEMENTED)
mod_CLOUDsolub	Solubility fractions for the indirect effect.
mod_CLOUDerf	Present-day RF used as reference for the indirect effect.
mod_CLOUDpreind	Adjustment of preindustrial burden of hydrophilic aerosols.
mod_ALBBCreg	Regionalization of BC deposition on snow.
mod_ALBBCrf	Radiative efficiency with respect to emissions of BC deposition on snow.
mod_ALBBCwarm	Warming efficacy of BC deposition on snow.
mod_ALBLCalb	Albedo climatology for LCC albedo effect.
mod_ALBLCcover	Land-cover climatology for LCC albedo effect.
mod_ALBLCwarm	Warming efficacy of LCC albedo effect.
mod_TEMPresp	Global surface temperature response.
mod_TEMPpattern	Experiment for pattern scaling of temperature.
mod_PRECresp	Global precipitations response.
mod_PRECradfact	Atmospheric fractions of RF for global precipitations.
mod_PRECpattern	Experiment for pattern scaling of precipitations.
mod_ACIDsurf	(NOT DESCRIBED IN PAPER) Functional form for surface ocean acidification.
mod_SLR	(NOT IMPLEMENTED)

Load order

After reading the chosen simulation options, the main file execute four other files: `OSCAR-loadD.py` used to load the drivers, `OSCAR-loadP.py` used to load the parameters, `OSCAR-format.py` used to format the drivers, and `OSCAR-fct.py` used to load the model's main function. When using the model in a probabilistic setup, the two load files can be used separately, albeit with two important limitations: `OSCAR-loadD.py` must be followed by `OSCAR-format.py`, and the two options `data_LULCC` and `mod_LSNKcover` affect both the drivers and the parameters of the model. In a probabilistic setup, it is recommended to reload `OSCAR-fct.py` each time, or to be careful with the drivers of `OSCAR_lite` since it already has default arguments from the initial loading. The two following sections give details of the structure of the two load files.

OSCAR-loadD.py

A. VECTORS
  A.1. Regions
  A.2. Sectors

`OSCAR-loadP.py`

Drivers, variables and parameters names and units

Here we provide the correspondence between the notations used in the description paper and the names used in the model's code, as well as the (implicit) units used in the model. In some cases there is no direct correspondence, because of the way the model is actually coded. Names should remain self-explanatory.

Drivers

In paper	In code	Unit
E_{FF}	EFF	GtC yr^{-1}
